                                                                                                                                                                                                                                                                                              AAB99676 standard; protein; 2005 AA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes human sodium channels SCNIA and SCNIA. The present sequence represents the human sodium channel SCNIA. SCNIA and SCNIA have been located to the human chromosome 2 long arm, positions 2024 and 2024-31 respectively. The sodium channel proteins are useful in studying the physiological mechanism in which excitant cells participate and cause human diseases, and in developing remedies for e.g. familial hypercal caemic periodic paralysis of extremities and motor endplate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1999 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 1; Page 40-49; 88pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a method (MI) of determining an condition to epilepsy and/or development of epilepsy, cc individual's predisposition to epilepsy and/or development of epilepsy, cc as well as predicting the individual's response to medication. The method cc comprises determining the genotype of at least one gene selected from cc controls a linkage disequilibrium. SCN1a, SCN2a and SCN3a are all sodium cc channel genes located on chromosome 2. The idiopathic generalised cc epilepsy (IGE) gene is more specifically localised on chromosome 223-cc q31. Compounds identified as modulators of the biological activity of cc SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating epilepsy cr other neurological disorders. They have anticonvulsant and cc represent SCN1A, SCN2A, and SCN3A cDNAs, gene fragments, PCR primers, cc oligonucleotides and proteins given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

diagnosing

GEFS+

The invention relates to a novel method for identifying a subject predisposed to a disorder associated with ion channel dysfunction. The method comprises ascertaining if at least one of the genes encoding channel subunits (ICS) has undergone a mutation event so that a cDNA derived from the subject has any of 134 nucleotide sequences. The method the invention has nootropic, neuroprotective, inotropic, antipyrel antiarrhythmic, antimigraine, antidepressant, antiparkinsonian, neuroleptic, tranquillser, analgesic, nephrotropic, antidiabetic, anophthalmological activity. A polynucleotide of the invention acts as

antipyretic,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC ion channel agonist, or ion channel antagonist. The methods, isolated CC nucleic acids, polypeptides, antibody, selective agonist, antagonist or CC modulator of an ion channel, cells and genetically modified non-human CC animal, are useful for the diagnosis and treatment of epilepsy and/or a CC disorder associated with ion channel dysfunction, such as hyper- or hypock alemic periodic paralysis, myotonias, malignant hyperthermia, CC myasthenia, cardiac arrhythnias, episodic attaxia, migraine, Alzheimer's CC disease, Parkinson's disease, schizophrenia, hyperkplexia, anxiety, CC depression, phobic obsessive symptoms, neuropathic pain, inflammatory CC pain, chronic/acute pain, Bartter's syndrome, polycystic kidney disease, CC fibrosis, congenital stationary night blindness and total colour CC fibrosis, congenital stationary night blindness and total colour CC fibrosis, congenital stationary night blindness and total colour CC fibrosis, congenital stationary night blindness and total colour CC invention. The sequence atta for this patent is not represented in the CC invention, but was obtained in electronic format directly CC from WIPO at ftp.wipo.int/pub/published_pat_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC The invention relates to a novel method for identifying a subject CC predisposed to a disorder associated with ion channel dysfunction. The CC method comprises ascertaining if at least one of the genes encoding ion channel subunits (ICS) has undergone a mutation event so that a cDNA CC derived from the subject has any of 134 nucleotide sequences. The method cof the invention has nootropic, neuroprotective, inotropic, antipyretic, creativety, thing, antidgraine, antidepressant, antiparkinsonian, complication acts as an ion channel agonist, or ion channel antagonist. The methods, isolated complicated acids, polypeptides, antibody, selective agonist, antagonist or complicated with ion channel antagonist. The methods, isolated complicated acids are polypeptides, antibody, selective agonist, antagonist or channel, cells and genetically modified non-human complicated with ion channel dysfunction, such as hyperore or hypocatemic periodic paralysis, myctonias, malignant hyperthermia, crimity, arrivals, arrivhthmias, episodic attaxia, migraine, Alzheimer's compensation, phobic obsessive symptoms, neuropathic pain, inflammatory pain, chronic/acute pain, Bartter's syndrome, polycystic kidney disease, fibrosis, congenital stationary night blindness and total colour colours, condenses. The present sequence represents a mutant protein of the colours of the sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly axia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      88888888888888888888888888888888

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cc predisposed to a disorder associated with ion channel dysfunction. The cmethod comprises ascertaining if at least one of the genes encoding ion channel subunits (ICS) has undergone a mutation event so that a cDNA cc derived from the subject has any of 134 nucleotide sequences. The method of the invention has mootropic, neuroprotective, inotropic, antipyretic, antiarrhythmic, antimigraine, antidepressant, antiparkinsonian, continually antipyretic, and cophthalmological activity. A polynucleotide of the invention acts as an control on channel agonist, or ion channel antagonist. The methods, isolated nucleic acids, polypeptides, antibody, selective agonist, antagonist or modulator of an ion channel, cells and genetically modified non-human cc mimal, are useful for the diagnosis and treatment of epilepsy and/or a disorder associated with ion channel dysfunction, such as hyper- or hypockalemical periodic paralysis, myotonias, malignant hyperthermia, cardiac arrhythmias, episodic ataxia, migraine, Alzheimer's cdisease, Parkinson's disease, schizophrenia, hyperkplexia, anxiety, cc depression, phobic obsessive symptoms, neuropathic pain, inflammatory cantor of disease, hyperinsulinaemic hypoglycaemia of infancy, cystic cont's disease, hyperinsulinaemic hypoglycaemia of infancy, cystic cont's disease, hyperinsulinaemic hypoglycaemia of total colour control of the present sequence represents a mutant protein of the invention. The sequence data for this patent is not represented in the control of the con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The method comprises detecting the level and/or activity of a transcription or translation product of the gene coding for the voltage-gated ion channel SCN2A. The modulator of an activity and/or of a level of at least one substance is useful for preparing a composition for treating or preventing a neurodegenerative disease, in particular Alzheimer's disease. The current sequence represents the human SCN2A amino acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 200
N-PSDB;
                                                                                                                                                                                                                     Determining a predisposition to epilepsy and/or development of epilepsy comprises determining the genotype of SCN1A, SCN2A and/or SCN3A, or a DI variant, equivalent, or mutation which shows a linkage disequilibrium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Diagnosing or prognosticating a neurodegenerative disease by detecting the level or activity of transcription or translation products of the gene coding for the voltage-gated ion channel SCN2A.

```

The present invention describes a method (M1) of determining an individual's predisposition to epilepsy and/or development of epilepsy as well as predicting the individual's response to medication. The met comprises determining the genotype of at least one gene selected from SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation which

of epilepsy,

gated sodium channel, useful for diagnosis of epilepsy, particularly
generalized epilepsy with febrile seizures plus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   generalised epilepsy with febrile seizures plus; myasthenia; sodium channel dysfunction; malignant hyperthermia; neuropathic pain; inflammatory pain; Alzheimer's disease; Parkinson's disease; myotonia; schizophrenia; hyperekplexia; anticonvulsant; analgesic; neuroprotective; nootropic; anti-Parkinsonian; neuroleptic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    shows a linkage disequilibrium. SCN1a, SCN2A and SCN3A are all sodium channel genes located on chromosome 2. The idiopathic generalised epilepsy (IGE) gene is more specifically localised on chromosome 2g33-g31. Compounds identified as modulators of the biological activity of SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating epilepsy or other neurological disorders. They have anticonvulsant and neuroprotective activities. AAH55763 to AAH56164 and AAB99679 to activities. AAH55763 to AAH56164 and AB99679 to Porcesent SCN1A, SCN2A, and SCN3A CDNAs, gene fragments, PCR primers, oligonucleotides and proteins given in the exemplification of the present

The invention relates to a nucleic acid molecule encoding a mutant alpha subunit of a mammalian voltage-gated sodium channel. The DNA and the polypeptide may be used in the diagnosis of epilepsy, in particular generalised epilepsy with febrile seizures plus, and other disorders associated with sodium channel dysfunction. The polypeptide is useful for the screening of candidate pharmaceutical agents, where high throughput screening techniques are employed. The sequences are also useful in the manufacture of a medicament for the treatment of a disorder associated with sodium channel dysfunction such as epilepsy, particularly generalised epilepsy with febrile seizures plus, malignant hyperthermia, myasthenia, episodic ataxia, neuropathic and infiammatory pain, alzheimer's disease, Parkinson's disease, schizophrenia, hyperekplexia

                                                                The invention relates to a nucleic acid molecule encoding a mutant alpha subunit of a mammalian voltage-gated sodium channel. The DNA and the polypeptide may be used in the diagnosis of epilepsy, in particular generalised epilepsy with febrile seizures plus, and other disorders associated with sodium channel dysfunction. The polypeptide is useful for the screening of candidate pharmaceutical agents, where high throughput screening techniques are employed. The sequences are also useful in the manufacture of a medicament for the treatment of a disorder associated with sodium channel dysfunction such as epilepsy, marticularly generalised epilepsy with febrile seizures plus, malignant hyperthermia, myasthenia, episodic ataxia, neuropathic and inflammatory pain, mlzheimer's disease, Parkinson's disease, schizophrenia, hyperekplexia and myotonias. Sequences ABG69289-ABG69293 represent human sodium channel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid encoding mutant alpha subunit of a mammalian voltage-gated sodium channel, useful for diagnosis of epilepsy, particularly generalized epilepsy with febrile seizures plus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 47; Page 107-117; 198pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        N-PSDB; ABK98843.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           20-DEC-2000; 2000AU-00002203

                                                                                                                                                            The invention relates to a nucleic acid molecule encoding a mutant alpha subunit of a mammalian voltage-gated sodium channel. The DNA and the polypeptide may be used in the diagnosis of epilepsy, in particular generalised epilepsy with febrile seizures plus, and other disorders associated with sodium channel dysfunction. The polypeptide is useful for the screening of candidate pharmaceutical agents, where high throughput screening techniques are employed. The sequences are also useful in the manufacture of a medicament for the treatment of a disorder associated with sodium channel dysfunction such as epilepsy, particularly generalised epilepsy with febrile seizures plus, malignant hyperthermia, myasthenia, episodic ataxia, neuropathic and inflammatory pain, Alzheimer's disease, Parkinson's disease, schizophrenia, hyperekplexia and myotonias. Sequences ABG59289-ABG69293 represent human sodium channel alpha 1-subunit (SCNIA) polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid encoding mutant alpha subunit of a mammalian voltage-
gated sodium channel, useful for diagnosis of epilepsy, particularly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         subunit of a mammalian voltage-gated sodium channel. The DNA and the polypeptide may be used in the diagnosis of epilepsy, in particular generalised epilepsy with febrile seizures plus, and other disorders associated with sodium channel dysfunction. The polypeptide is useful for the screening of candidate pharmaceutical agents, where high throughput screening techniques are employed. The sequences are also useful in the manufacture of a medicament for the treatment of a disorder associated with sodium channel dysfunction such as epilepsy, particularly generalised epilepsy with febrile seizures plus, malignant hyperthermia, myasthemia, episodic ataxia, neuropathic and inflammatory pain, highelmer's disease, Parkinson's disease, schizophrenia, hyperekplexia and myotonias. Sequences ABG69289-ABG69293 represent human sodium channel alpha 1-subunit (SCNIA) polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid encoding mutant alpha subunit of a mammalian voltage-
gated sodium channel, useful for diagnosis of epilepsy, particularly
generalized epilepsy with febrile seizures plus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        sodium channel dysfunction; malignant hyperthermia; neuropathic pain; inflammatory pain; Alzheimer's disease; Parkinson's disease; myoconia; schizophrenia; hyperekplexia; anticonvulsant; analgesic; neuroprotective; nootropic; anti-Parkinsonian; neuroleptic.

The DNA and the polypeptide may be used in the diagnosis of epilepsy, in particular generalised epilepsy with febrile seizures plus, and other disorders associated with sodium channel dysfunction. The polypeptide is useful for the screening techniques are employed. The sequences are also useful in the manufacture of a medicament for the treatment of adsorder associated with sodium channel dysfunction such as epilepsy, particularly generalised epilepsy with febrile seizures plus, malignant hyperthermia, myasthenia, episodic ataxia, neuropathic and inflammatory pain, Alzhelmer's disease, Parkinson's disease, schizophrenia, hyperekplexia and myotonias. Sequences ABG69289-ABG69293 represent human sodium channel alpha 1-subunit (SCN1A) polypeptides of the invention

The gene is useful for diagnosing GEFS+. The present sequence represents the human GEFS+ protein sequence with SCNIA
                                                                                                                                                                                                                   Domain

       The invention relates to human transporters and ion channels (TRICH) polypeptides and their cDNA molecules. The nucleic acid and polypeptide sequences are useful in the diagnosis, treatment, and prevention of disorders associated with transport (akinesia, cystic fibrosis, Bell's palsy, amyotrophic lateral sclerosis); neurological (Alzheimer's disease.

The polynucleotides may be used to detect and quantify gene expression in biopsied tissues in which TRICH expression may be correlated with a disease, to generate hybridization probes for mapping naturally occurring genomic sequence, and in drug screening. The present sequence is human TRICH-13 protein
                                                                                                               Identifying predisposition to an ion channel dysfunction, such as periodic paralysis, cardiac arrhythmias, migraine, Alzheimer's dischizophrenia, anxiety and depression, by detecting encoding-gene

```

The invention relates to a novel method for identifying a subject predisposed to a disorder associated with ion channel dysfunction. T method comprises ascertaining if at least one of the genes encoding channel subunits (ICS) has undergone a mutation event so that a cDNA derived from the subject has any of 134 nucleotide sequences. The me of the invention has nootropic, neuroprotective, inotropic, antipyre

antipyretic,

. The method

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel method for identifying a subject CC predisposed to a disorder associated with ion channel dysfunction. The CC method comprises ascertaining if at least one of the genes encoding ion CC channel subunits (ICS) has undergone a mutation event so that a cDNA CC derived from the subject has any of 134 nucleotide sequences. The method of the invention has nootropic, neuroprotective, inctropic, antipyretic, CC antiarhythmic, antimigraine, antidepressant, antiparkinsonian, neuroleptic, tranquiliser, analgesic, nephrotropic, antidiabetic, and cpphthalmological activity. A polymucleotide of the invention acts as an conclusic acids, polypeptides, antibody, selective agonist, antagonist or mucleic acids, polypeptides, antibody, selective agonist, antagonist or cmodulator of an ion channel diagnosis and treatment of epilepsy and/or a conclusion of the diagnosis and treatment of epilepsy and/or a conclusion, are useful for the diagnosis and treatment of epilepsy and/or a conclusion paralysis, myotonias, malignant hyperthermia, are useful for the diagnosis and treatment of epilepsy and/or a conclusion, phobic obsessive symptoms, neuropathic parin, linflammatory conclusion, phobic obsessive symptoms, neuropathic pain, inflammatory conclusion, phobic obsessive symptoms, neuropathic pain, inflammatory contributed specification, but was obtained in electronic format directly from wipo at ftp.wipo.int/pub/published_pat_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cc predisposed to a disorder associated with ion channel dysfunction. The method comprises ascertaining if at least one of the genes encoding ion channel subunits (ICS) has undergone a mutation event so that a cDNA cc derived from the subject has any of 134 nucleotide sequences. The method cc antiarrhythmic, antimigraine, antidepressant, antiparkinsonian, cc neuroleptic, tranquiliser, analgesic, nephrotropic, antidabetic, and cophthalmological activity. A polynucleotide of the invention acts as an ci on channel agonist, or ion channel antagonist. The methods, isolated concleic acides, polypeptides, antibody, selective agonist, antagonist or modulator of an ion channel, cells and genetically modified non-human act disorder associated with ion channel dysfunction, such as hyper- or hypock alemic periodic paralysis, myotonias, malignant hyperthermia, cardiac arrhythmias, episodic ataxia, migraine, Alzheimer's cdisease, Parkinson's disease, schizophrenia, hyperthermia, anxiety, cc depression, phobic obsessive symptoms, neuropathic pain, inflammatory cannot be present sequence represents a mutant protein of the invention. The sequence data for this patent protein of the christication, but was obtained in electronic format directly crinted specification, but was obtained in electronic format directly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

The invention relates to a novel method for identifying a subject CC predisposed to a disorder associated with ion channel dysfunction. The CC method comprises ascertaining if at least one of the genes encoding ion CC channel subunits (ICS) has undergone a mutation event so that a cDNA CC derived from the subject has any of 134 nucleotide sequences. The method CC of the invention has nootropic, neuroprotective, inotropic, antipyretic, CC antiarrhythmic, antimigraine, antidepressant, antiparkinsonian, CC encuroleptic, tranquiliser, analgesic, nephrotropic, antidiabetic, and CC ophthalmological activity. A polynucleotide of the invention acts as an CC in channel agonist, or ion channel antagonist. The methods, isolated CC mucleic acids, polypeptides, antibody, selective agonist, antagonist or CC modulator of an ion channel, cells and genetically modified non-human CC alimal, are useful for the diagnosis and treatment of epilepsy and/or a disorder associated with ion channel dysfunction, such as hyper- or hypock kalemic periodic paralysis, myotonias, malignant hyperthermia, cCC myasthenia, cardiac arrhythmias, episodic attaxia, migraine, Alzheimer's CC disease, Parkinson's disease, schizophrenia, hyperkplexia, anxiety, CC depression, phobic obsessive symptoms, neuropathic pain, inflammatory pain, chronic/acute pain, Bartter's syndrome, polycystic kidney disease, pent's disease, hyperinsulinaemic hypoglycaemia of infancy, cystic convention. The present sequence represents a mutant protein of the invention. The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly ccc from MIPO at tfo. Int/nub/nub/shel nat securence

                                 S
                                                                                                                                                              The invention relates to a novel method for identifying a subject CC predisposed to a disorder associated with ion channel dysfunction. The CC method comprises ascertaining if at least one of the genes encoding ion channel submitts (ICS) has undergone a mutation event so that a cDNA CC derived from the subject has any of 134 nucleotide sequences. The method contribution has nootropic, neuroprotective, inotropic, antipyretic, contribution, antimigratine, antidepressant, antiparkinsonian, contribution, and contribution acts and contribution agonist, or ion channel antagonist. The methods, isolated contributed agonist, or ion channel antagonist. The methods, isolated contributed activity. A polynucleotide of the invention acts as an nucleic acids, polypeptides, antibody, selective agonist, antagonist or mucleic acids, polypeptides, antibody, selective agonist, antagonist or animal, are useful for the diagnosis and treatment of epilepsy and/or a contribution of an ion channel dysfunction, such as hyper- or hypotalemia, are useful for the diagnosis and treatment of epilepsy and/or a contribution arrhythmias, episodic ataxia, migraine, Alzheimer's disease, Parkinson's disease, schizophrenia, hyperthermia, anxiety, contributed sparalysis, myotonias, meuropathic pain, inflammatory pain, chronic/acute pain, Bartter's syndrome, polycystic kidney disease, pain, chronic/acute pain, Bartter's syndrome, polycystic kidney disease, congenital stationary night blindness and total colour contributed specification, but was obtained in electronic format directly xxx
                                                                             Query Match

"Direct amplification of a single dissected chromosomal segment by polymerase chain reaction: a human brain sodium channel gene is on the chromosome 2q22-q23.";

Proc. Natl. Acad. Sci. U.S.A. 88:335-339(1991).

Proc. Natl. Acad. Sci. U.S.A. 88:335-339(1991).

C of excitable membranes. Assuming opened or closed conformations in response to the voltage difference across the membrane, the protein forms a sodium selective channel through which Na(+) ions may pass in accordance with their electrochemical gradient.

C -! SUBUNIT: The sodium channel consists of a large polypeptide and 2-

3 smaller ones. This sequence represents a large polypeptide.

-! SUBCELLULAR LOCATION: Integral membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               subtype II alpha-Subunit (SCN2A).";

"Differential expression of two sodium channel subtypes
Isord=099250-2; Sequence=VSP_001032;

DOMAIN: The sequence contains 4 internal repeats, each with 5 hydrophobic segments (S1,S2,S3,S5,S6) and one positively charged segment (S4). Segments S4 are probably the voltage-sensors and at characterized by a series of positively charged amino acids at

C. -i FUNCTION. Mediates the voltage-dependent sodium ion permeability of excitable membranes. Assuming opened or closed conformations in response to the voltage difference across the membrane, the protein forms a sodium-selective channel through which Na(+) ions may pass in accordance with their electrochemical gradient.

-i-SUBUNIT: The sodium channel consists of a large polypeptide and 2-3 smaller ones. This sequence represents a large polypeptide.

-i-SUBCELLULAR LOCATION: Integral membrane protein.

-i-DOMAIN: The sequence contains 4 integral repeats, each with 5 hydrophobic segments ($1,82,53,55) and one positively charged segment ($4). Segments $4 are probably the voltage-sensors and are characterized by a series of positively charged amino acids at every third position.

-i-SIMILARITY: Belongs to the sodium channel family.

-i-SIMILARITY: Contains 1 IQ domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

Submitted (JAN-1999) to the EMBL/GenBank/DDBJ databases.

CC -!- SUBCELLULAR LOCATION: Integral membrane protein (By similarity).

CC -!- SIMCLARITY: Belongs to the sodium channel family.

CC -!- SIMILARITY: Belongs to the sodium channel family.
